

ABSTRACT OF THE DISCLOSURE

A negative electrode active material includes a composition A-B-C containing a first element A which is at least one selected from copper and iron, a second element B which is at least one selected from silicon and tin, and a third element C which is at least one selected from the group consisting of indium, antimony, bismuth, and lead. A nonaqueous electrolyte battery includes a negative electrode containing the negative electrode active material, a positive electrode containing a positive electrode active material, and a nonaqueous electrolyte. The nonaqueous electrolyte battery has a large discharge capacity and excellent cycle performance.
